Now we define the class of owner of the Account at the Bank

public class Client
{
    // First field is the name of the client
    private String owner;

    // Second field is the amount to be deposited each month
    private double monDeposit;

    // Third field is the account number assigned to his/her account
    private int accountNumber;

    // Constructors
    public Client(String name)
    {
        owner = new String(name);
        accountNumber = 0;
        monDeposit = 0.0;
    }

    public Client(String name, double deposit)
    {
        owner = new String(name);
        accountNumber = 0;
        monDeposit = deposit;
    }

    // Mutator
    public void putAccountNumber(int myNumber)
    {
        accountNumber = myNumber;
    }
    public void newDeposit(double newDepo)
    {
        monDeposit = newDepo;
    }

    // Accessors
    public String getOwner()
    {
        return owner;
    }
    public int getAccountNumber()
    {
        return accountNumber;
    }
    public double getMDeposit()
{  
   return monDeposit;
}

} // End of the Client class
